Cassy v4.21.0

RELEASE REPORT · PUBLISHED 12 NOVEMBER 2026 · 5:50 PM ET

Releases now have evidence-backed scores, and delivery checks follow the work they protect.

30 changes listed across 4 areas; Tasks has the most, 11.

One dot, one shipped change. No GitHub issues are counted in this report's fixes ledger.

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v4.21.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Sessions	5	Every factory check has a stable code; Measure actual policy exceptions; Checkout refusals name the checkout fix; Session ownership checked once; Count each surviving rule once
Tasks	11	Approvals survive train moves; Delivery review and intervention detail; Scorers with cited hits; Approval policy registry API; Lane CI runs the delivery's impacted tests; Adopt a commit named for another task; Every delivery records its cycle; Published start bases and successor deliveries; One origin read per merge; No-code report deliveries can close at release again; Keep approvals attached to their delivery cycle
Releases	9	Shared docs are generated at the release cut; Derived release inputs; Linked worktree project identity; Replay stores outside Git; Journey-catalog row explains a missing registry policy; Count script and merge decisions; Release check rates count real runs; Gate token assertions; Ratchet uncoded caller-authority refusals
Other	5	Registry validation in clean checkouts; Recorded CLI arguments; Registry; Count rebinds once; One project resolver
Total	30	4 areas

Changes listed

7 changed, 7 added, 16 fixed; tests and docs excluded

8 min 17 s

Main to published

5:42:40 PM → 5:50:57 PM ET

7 h 2 min

Approval to published

10:49 AM → 5:50:57 PM ET; 30-minute target missed

Changes and GitHub issues are counted separately. A change is one titled entry in the v4.21.0 CHANGELOG section; entries under Test, Doc, Known limits, Upgrade, Migration or Operator guidance headings are listed under the hood but not counted. A GitHub issue counts when release PR #1882 or the CHANGELOG section references it and it closed between the PR opening (4:21 PM ET) and 15 minutes after its merge (5:57 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. Green-to-published time, cut time, blocker count, lesson recurrence and manual intervention count are unavailable. Approval-to-published time comes from the release handoff; it is not a green-to-published measurement.

What you can do now

Everyday use

Release scorecards

WAS

the ledger report listed reviews, verdicts and notices, and nobody graded them.

NOW

it scores five rubrics per release, cites the evidence for each score, and tracks how long a release sat ready without being cut.

Pushes test what they touch

WAS

a push proved only the tests its author chose to name.

NOW

CI runs the delivery's own tests first, then the tests around it, and says whether a failure was caused by the change or was already there.

One identity per delivery

WAS

moving work between trains could drop its approval or attach it to the wrong cycle.

NOW

every delivery records its cycle, approvals stay attached across moves, and one project resolver serves every check.

Fewer repeated checks

WAS

a merge asked GitHub about its target up to four times, and some checks ran again at park.

NOW

one read per merge, and each check runs once, in CI.

Clearer refusals

WAS

many refusals were free text.

NOW

every check has a stable code, and refusals name the fix.

03 / 06

Under the hood

Sessions

Coded checks and measured exceptions

WAS

Refusals were free text; replay could inflate exception counts.

NOW

Checks declare stable codes. `cas gates list` inventories them; reports count refusals and exceptions. Only accepted override tags add facts, and an audit inventory rejects uncovered policy sites.

Clearer refusals, fewer repeated checks

WAS

Checkout refusals gave commit advice; ownership and lint checks repeated.

NOW

Checkout refusals name the checkout fix. Ownership runs once after inference, before effects. Lint stays in CI; shared guards use stable codes, and recorded native child messaging is permitted.

Tasks

Approvals stay with the reviewed work

WAS

Sibling landings triggered repeat reviews; new reviews could obscure approved work.

NOW

An unchanged patch and clean merge carry approval with an audit note. Policy stamps exclude later requirements but retain integrity checks; carried approvals keep cycle, registry version, source and shipped-tree checks.

Delivery detail and release scores

WAS

Release totals hid delivery detail; events had no grades.

NOW

Reviews carry cycle and provenance; sourced wakes, interventions and backfills avoid duplicates. Five four-label rubrics score reviews, verdicts, holds, green-but-uncut time and held/idle time, citing each hit. Scores do not gate work.

Test the delivery before it merges

WAS

Pushes proved named tests; wider breakage appeared after merge.

NOW

CI runs the recorded start-base impact set: own tests, then up to three shards. Broad changes run all tests. Every unsuccessful outcome, including timeout, signal and leak failure, must be inherited to stay nonblocking.

Durable delivery identity and successors

WAS

Follow-up commits could appear foreign; park identity was reconstructed; local unpublished commits could enter start bases.

NOW

A supervisor's saved `merge_source=<full SHA>` grant adopts a commit and ancestors. Synced anchors persist cycles and tips; reopen starts another cycle. Starts use published targets; explicitly named successors can deliver cancelled predecessors' recorded commits.

One target read and a working release close

WAS

Three train entries made 24 origin reads; reports without cycles could hold release close.

NOW

The locked fetch is reused: three reads for three entries; new review still refreshes. No-cycle reports use the reviewed-commit verdict, and cut refusals list holds and members missing review.

Releases

Fragments and derived release inputs

WAS

Parallel shared-doc edits conflicted; release proof inputs were assembled by hand.

NOW

Release prep folds delivery fragments into shared docs once. Cuts derive proof from recorded references and ledgers; saved previews bind final trees and permit later review.

Reliable worktree and store previews

WAS

Missing local configuration or a relocated store could break preview identity.

NOW

Linked worktrees inherit canonical identity through Git's common directory; local pins win. Relocated stores replay with repository, candidate-key, source and tree checks intact.

Recorded decisions and explicit policy failures

WAS

Policy errors could fail silently; decision counts and identity-dependent refusal inventories had gaps.

NOW

Policy failures name the bad value or revision and fix. Scripts, merge, CI, MCP and hooks record coded decisions. Refusal exits stay failures; a provenance-aware audit rejects new uncoded sites and only shrinks its baseline.

Accurate checks and declared test tokens

WAS

Admissions and duplicate ejections inflated totals; registered codes could look like prose pins.

NOW

Checks count this project's actual results once, retaining run links, observed minutes, untimed counts and separate cohorts. Admission and lint accept declared bracketed codes; unknown tokens and prose pins still fail.

Other

Clean-checkout validation and developer lint

WAS

Legacy validation needed a store; quoted CLI arguments and repeated freshness codes caused friction.

NOW

Explicit registry policy works without a store; strict policy needs base-aware validation. Lint accepts recorded `shlex.split` arguments. G-105 folds into G-110: 400 checks instead of 401.

One rebind identity and one project resolver

WAS

Aliases could double-count rebinds; stamps and scope could resolve different projects.

NOW

Live and backfilled rebinds share identity without deleting history or merging unrelated actions. Selector stamps and scope matching use the same ordered identities, including the main linked-worktree project pin.

Evidence and scope

Retrieved: 12 November 2026 · 7:22 PM ET. Sources describe v4.21.0, not later changes.

Release: GitHub v4.21.0 (https://github.com/Richards-LLC/cassy/releases/tag/v4.21.0), published 12 November 2026 at 5:50:57 PM ET. Tag commit: 13663d4ace11974d92c7829f5eadde089acb5615. Release merge: 49adb1d6, PR 1882 (https://github.com/Richards-LLC/cassy/pull/1882).

Change-map source: published CHANGELOG (https://github.com/Richards-LLC/cassy/blob/v4.21.0/CHANGELOG.md), exactly 30 titled entries. Area assignment and order are the generator's Sessions, Tasks, Releases, Other classification. Counts measure listed changes, never effort or impact. The five user themes summarise the release; the technical ledger groups all 30 changes into 13 related entries.

User and developer context: publication draft (https://github.com/Richards-LLC/cassy/blob/main/docs/release-notes/2026-11-12-v4.21.0-slack.md). Posted User thread (https://petra-stella.slack.com/archives/C0B44GUKDK2/p1794524147693109) and Dev thread (https://petra-stella.slack.com/archives/C0B44GUKDK2/p1794524182619939). The issue count is generator-derived from the release PR and CHANGELOG references, from PR opening at 4:21 PM ET through 5:57 PM ET; no qualifying GitHub issues closed in that window.

Publication and asset metadata were retrieved with `gh release view v4.21.0 --json tagName,targetCommitish,publishedAt,url,assets`; the two archive digests match the release handoff. That handoff records completed installs on soundwave (Linux x86_64) and prowl (macOS ARM64). This report does not rerun those installs or claim hosted/GUI coverage beyond the handoff.

Pipeline latency

FAIL — Approval to published took 7 h 2 min against a 30-minute target. Approval was at 10:49 AM ET; publication was at 5:50:57 PM ET on 12 November 2026. The reported duration is rounded to minutes and missed the target by about 6 h 32 min. The release handoff supplies the approval endpoint; the GitHub release supplies the publication endpoint. A successful final build does not erase this missed target.

Main to published took 8 min 17 s: merge at 5:42:40 PM ET to publication at 5:50:57 PM ET. This measures only the final publication interval. It is not approval-to-published or green-to-published time. No green endpoint or complete stage-by-stage latency receipt was available; compiler time, waiting time and individual blockers cannot be apportioned from these two intervals.

Limits: prior states without an explicit Was in CHANGELOG are inferred from the described fix or addition. The report generator's JSON-draft extraction and duplicated fallback prose were corrected editorially against the saved draft and published CHANGELOG. Before/after image pairs were unavailable, so none are invented. No additional performance, adoption or reliability claim follows from the change count.
