What you can do now

02 / 06

Only reply:

Reports you can open

WAS

a finished report sat in a folder you had to go find. →

NOW

it is recorded with its size and fingerprint and can be handed to you directly.

Messages meant for you

WAS

an update only reached you if you had asked a question first. →

NOW

a status, an outcome, a question or a hold can reach you as it happens, each marked for what it is.

Your open issues stay visible

WAS

your session summary quietly dropped the list of open issue titles when other guidance grew. →

NOW

the titles stay and the boilerplate shrinks instead.

Passwords stay hidden

WAS

a sign-in token could be written into an error message or log. →

NOW

it is replaced with a placeholder everywhere, with a check that keeps it that way.

Faster doc changes

WAS

a documentation-only change waited on the full build. →

NOW

it runs a short text check and lands in minutes.

Clearer setup warnings

WAS

a mismatch between this machine and its cloud record stayed silent until syncing failed. →

NOW

the checkup names it and prints the exact line to fix.

Under the hood

03 / 06

Only reply:

Artifact publish

WAS

no durable record for a produced file. →

NOW

cas artifact publish|show|list plus the MCP tool records size and SHA-256, refuses escaping symlinks and .cas/.git, caps at 25 MiB before any request, and falls back to local-only when Cloud storage answers 404/501.

Operator turn kinds	WAS <code>target=operator</code> required <code>in_reply_to</code>, so only answers could reach the hub. → NOW payload v2 carries kind and attachments; unprompted kinds route to the latest verified device, v1 still decodes.
SessionStart budget	WAS protected guidance grew and the assembler compacted the issue-triage evidence instead. → NOW the Codex note is degradable and a pin fails the build when guidance leaves under 2400 B of the 9216 B budget.
Credential redaction	WAS fourteen structs derived <code>Debug</code> over a live bearer, API key or pre-signed URL. → NOW each redacts, with a repo-wide guard test that resolves its tree at runtime.
Docs-only CI tier	WAS every docs change ran the full required tier. → NOW a classifier routes docs-only events to <code>Docs Lint</code>, which lints only Markdown; required contexts still report.
Close gate	WAS expected proof base came from the current checkout, so a merged-before-close delivery was unprovable. → NOW it comes from the delivery's first parent, and a supervisor can widen proof targets in one reasoned call.
Doctor	WAS alias checks passed while the git remote matched neither canonical id nor alias, and <code>--fix --json</code> emitted two documents. → NOW drift is a warning with the exact remediation, identity conflicts count separately, and the JSON is one document.
Assets	WAS n/a. → NOW <code>cas-x86_64-unknown-linux-gnu.tar.gz</code> <code>281e936daa2650fab1ab426edb3090a4187fe2ba1d62acc6fe166c8d5515ce70</code>; <code>cas-aarch64-apple-darwin.tar.gz</code> <code>f36e0573d736c6b66d5d01ff1eecfb53cde677fd8ce2ebf1d12a1b8495bbe212</code>.
