What you can do now

02 / 06

Safety guards always on for Claude, plus Commander fixes

Safety guards always on for Claude

WAS Claude sessions Cassy started for you ran without its safety guards: no build caps, no memory check before heavy test runs, no publishing or Slack guards. →

NOW every one runs with them, and Cassy stops any session whose guards don't switch on.

Messages arrive with the wake-up

WAS when one Cassy session messaged another, the receiver woke to a bare "see inbox", found its inbox empty and got the message a turn later. →

NOW the message arrives in the turn it wakes.

No false "pairing was revoked"

WAS with Commander open in two tabs, renewing this browser's access in one tab could make the other say "pairing was revoked". →

NOW the other tab picks up the renewed access and carries on.

Codenames whole on phones

WAS the phone header could show a machine's codename cut short, like "patient...". →

NOW it shows in full beside the machine name, or steps aside entirely.

Safety

Workspace trust at spawn

WAS the PTY launch's `IS_DEMO=true` skipped Claude Code's trust dialog without trusting the cwd, so no `SessionStart` or `PreToolUse` hook ran and Claude workers had no capped cargo runner, worker-memory admission, or Slack, publication and browser guards. →

NOW the Claude backend's `prepare_workdir` merges only `projects[<cwd>].hasTrustDialogAccepted` into `.claude.json` before spawn, or refuses the launch.

Locked, atomic trust write

WAS Cassy wrote no Claude trust at all. →

NOW the merge runs under `.claude.json.cas-lock` via temp file, `fsync` and `rename`, is read back and retried once, and an empty or unparseable config refuses the launch untouched.

SessionStart hook canary

WAS nothing proved a Claude worker's hooks fired. →

NOW `SessionStart` writes `.cas/factory/hook-canary/<agent>.json`, and spawn, respawn and recycle verification kill and report a Claude worker with no fresh marker 60 s after launch.

Respawn after upgrading

WAS running Claude workers were started unguarded. →

NOW respawn them on 3.48.2; raw cargo, & jobs under worker-memory admission, non-Violet Slack writes, publication and unfiltered browser runs start being denied.

Messaging and Commander

Pointer wake carries its body

WAS a Claude teams handoff's `transport_claimed` receipt hid the row from the turn-start hook and `inbox_poll` while Claude Code held its copy, so the wake read "see inbox" over an empty inbox. →

NOW `UserPromptSubmit` surfaces the row named by CAS wake: `message N` over its claim as `hook_surfaced`.

Rendered vs claimed

WAS `message_status` could not tell a body rendered into a turn from one only claimed by the transport. →

NOW it reports `recipient_receipt`, and ordinary turns and polls still skip claimed rows.

Hook-free read

WAS without the turn-start hook, a claimed message could not be read until the next turn. →

NOW `inbox_poll notification_id=N` returns it to its recipient, and the wake text names that call.

Stale-credential retry	WAS two requests signed with a credential a peer tab had rotated were both refused <code>unknown_credential</code>, and only the adopter retried, so the other read "pairing was revoked". → NOW <code>authorizedFetch</code> retries whenever the machine's <code>credentialId</code> differs from the one it signed with.
Phone header codename	WAS <code>fitMachineLine</code> kept 8 ch of codename beside the machine, drawing a cut "patient...", and sub-pixel overflow ellipsised. → NOW the phone header passes <code>wholeCodename</code>, so the codename is whole or aside, with 2 px slack on every fit test.

Gates and tests

Journey reason at the delivered head	WAS <code>qa_pass::catalog_journeys_for</code> ran the store checkout's <code>journeys-for-diff.py</code>, so the close gate and QA dispatch could name a different set than <code>journey-eval</code>. → NOW it runs the selector and catalog committed at the delivered head.
Hub fixture waits for exit	WAS fixture cleanup sent <code>SIGTERM</code>, waited a fixed 0.5 s and escalated only while the hub held its lock, so a slow shutdown failed the reap test. → NOW it waits up to 15 s, then <code>SIGKILLS</code> the group.
Worker-memory spawn deadline	WAS the concurrent-admission tests gave counted commands 2 s to start and missed by 7 ms on a loaded host. → NOW <code>CAS_TEST_SPAWN_DEADLINE_SECS</code> bounds start-up at 20 s, and serial admission still fails.
Worker-memory refuses &	WAS a backgrounded suite lost its receipt launcher when the shell returned, while its Playwright runner lived on unreported. → NOW <code>--shell-command</code> refuses a bare <code>&</code> before admission; <code>&&</code>, <code>>&</code>, <code>&></code> and <code> &</code> pass.
