

Finished work is combined and checked continuously, so a release is one short check and out the door.

SURFACE		CLOSED
Release	no listed issues	0
Integration	no listed issues	0
Factory		1

Factory leads the closure map with 1 issue.

One dot, one closed issue. 1 issue-bearing surfaces.

What you can do now

02 / 06

Releases that do not wait

Combined as you go

WAS finished pieces were only combined at release time, and every clash surfaced then.

NOW every finished piece is combined with everything else the moment it lands, and clashes are reported to the person who owns them right away.

Proof that covers the change

WAS a change could pass its own checks and still break a neighbour.

NOW a change cannot be handed in until the checks that exercise it have run.

Small fixes move fast

WAS a one-line fix waited on the same long check as a big change.

NOW small, verified fixes are admitted immediately.

Fix rounds in parallel

WAS each failure was written up and fixed one after another.

NOW failures are grouped and handed out at once.

One short gate

WAS the final release check redid work already proven.

NOW proven results are reused and only what changed is rechecked.

Under the hood

03 / 06

Integration

Rolling integration branch

WAS epics were merged one by one at release time.

NOW each epic merge re-merges main plus every open epic into `integration/<project>`, runs the workspace sweep detached, and posts conflict pairs/files or failing targets to the owning supervisors and as epic notes.

Proof surface mapping

WAS `check-scoped-test-surface.sh` mapped files to tests that mention them; `--lib-only` proofs passed.

NOW changed modules require the integration binaries that exercise them plus class guardrails (skills → `builtin_*`, tests/ → archive portability, hooks → `hook_schema`); close refuses with the exact command.

Fast merge admission	WAS every lane waited 10–25 min on Scoped Validation. NOW <code>release-train.sh --check-lane</code> accepts a supervisor <code>--proof</code> receipt on the exact tip for small deltas, and a Scoped Validation (fast) tier compiles plus mapped targets; the policy is pinned by <code>test-ci-test-tiers.sh</code>.
Sweep → tasks	WAS sweep logs were read by hand into one task per round. NOW failures group by binary + panic site into <code>sweep-tasks.json</code>; coordination <code>action=sweep_tasks</code> previews and accepts, creating tasks and spawning workers idempotently.
Gate reuse from sweep receipts	WAS the gate reran nextest/archive rows already proven by the assembly sweep. NOW the integration sweep writes row-cache-v2 receipts; <code>--gate --reuse</code> accepts them for the exact tip with matching checkout, inputs, environment and toolchain under 24 h, and logs the source SHA.

Release gate

version-literals	WAS the row walked every file with <code>find</code>, including gitignored build caches. NOW tracked files only in a git checkout, with a self-test scenario.
------------------	---

Fixes ledger
