What you can do now

02 / 06

Only reply (user)

Your own work only

WAS a project's list slowly filled with tasks and memories from other projects. →

NOW every item remembers which project wrote it, and only those are shared with your team.

Real projects only

WAS container folders and old projects under Archive were refreshed like live projects. →

NOW only a Git folder or a pinned project counts; Archive and containers are left alone.

No borrowed stores

WAS a new repository inside another project quietly used its parent's store. →

NOW it has no store until you run `cas init` there.

See and clean up

WAS `cas doctor` counted only stray tasks. →

NOW it counts tasks, memories and rules from other projects or with no known owner, and names the command to remove or claim them.

Prompts stay private

WAS captured requests could be shared like any memory. →

NOW they stay on your machine.

Chrome ready

WAS Claude sessions Cassy started could use Chrome only if you had switched it on yourself. →

NOW every Claude session Cassy starts has Chrome available.

Under the hood

03 / 06

Only reply (dev)

Provenance

WAS only tasks had `origin_project`, re-stamped with the local project on every migration run. →

NOW m260 adds it to entries and rules, backfills once from `sessions.cwd` (else unknown), and stores stamp at creation.

Authored-only sync	WAS pushes stamped missing origins with the pushing project. → NOW enqueue and push refuse foreign or unknown rows, legacy payloads take the stored origin, and cas cloud status counts the skips.
Project roots	WAS cas update fan-outs registered containers and store lookup walked past the Git top level. → NOW is_project_root requires a Git top level or pinned canonical_id, and lookup stops at the repository boundary.
Queue and moves	WAS an upgrade requeued rows an older build had parked, and a task move pushed a copy under the new owner. → NOW only version-gate rows requeue, and a move queues just the old-key delete.
Audit	WAS doctor and purge covered tasks only. → NOW doctor classifies tasks, entries and rules as authored, foreign or unknown; purge-foreign --include-unknown and cas cloud adopt-unknown act on them.
Launch	WAS Claude sessions launched without a Chrome flag. → NOW --chrome is passed when the installed CLI supports it.

Fixes ledger
