Release at a glance

▼ What shipped, by area

One dot is one change listed in the v4.14.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Commander	1	Review current Commander bundles
Sessions	12	Keep managed mentions answerable on long threads; Worker names open timelines; Only real requests need your answer; Build overflow asks reach the peer machine; Parallel registry and documentation edits; Keep clean navigation files switchable; Quality sheet; Ledger per supervisor; Watchdog sender and completion handling; Enforce commit scope inside nested shells; Requested worker replies wake the supervisor; Bash scratchpad staging
Tasks	6	Bound transcript delivery alarms to recent decisions; Refresh an untouched successor's source branch; New tasks join the next release train; Shipped delivery inventory; Derived priority refusals; Keep close evidence at the shipped commit
Messages	1	Trust confirmed thread parts
Releases	3	Publishing or promoting a release closes it out once; Close shipped GitHub fixes at release; Durable release closeout
Slack and Cloud	2	Slack claim refusals retain the owner; Source Slack status reactions
Safety	1	Reachable post recovery
Other	1	Structured command assertions
Total	27	8 areas

Changes listed

21 fixed, 6 added; tests, docs, known limits and upgrade notes not counted

5

GitHub issues closed

Closed from PR #1787 opening to 15 min after merge

1,231 s / 1,200 s

Main to published

Missed by 31 s; main landing to publication

42,400 s / 1,800 s

First child to main

Missed by 40,600 s; first child commit to main landing

1

Queue runs

Final release tree checked in the merge queue

20m 34s

Green to published

Over budget (20m 0s budget); Merge-queue CI completion to publication

> Changes and GitHub issues are counted separately. A change is one titled entry in the v4.14.0 CHANGELOG section; entries under Test, Doc, Known limits, Upgrade, Migration or Operator guidance headings are listed under the hood but not counted. A GitHub issue counts when release PR #1787 or the CHANGELOG section references it and it closed between the PR opening (7:39 PM ET) and 15 minutes after its merge (8:09 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No batch QA round ran on this candidate. Validation is the merge queue on the final release tree. The measured commit-to-main and main-to-publication budgets were both missed. No release stage was recorded as blocked. No manual interventions were recorded. Not measured for this release: request to published, cut to published, lesson recurrence.

02 / 06

What you can do now

Releases that clean up after themselves

Releases close their own work

WAS

after a release, shipped tasks and workstreams stayed open and needed hours of manual cleanup.

NOW

publishing a Cassy release, or promoting a project from staging to main, closes everything it shipped exactly once, and sends one notice listing anything left, with its owner and next step.

Fixed issues close too

WAS

GitHub issues stayed open after their fix shipped.

NOW

an issue closes when every fix that references it has shipped, with a comment naming the version.

Only real questions wait on you

WAS

Tasks & progress and Team mixed genuine questions with work already moving, and finished workstreams stayed in the list.

NOW

only open questions ask for your answer, and finished workstreams leave the list.

Quality at a glance

WAS

no single view showed whether things were getting better or worse.

NOW

Quality, from the command palette, leads with the measure that slipped most since the last release, with its trend.

Names open timelines

WAS

a separate Activity pill opened a timeline, and the card and timeline could disagree on state.

NOW

click a name on its card to open its timeline, and both show the same state.

Slack shows progress on your request

WAS

a Slack request gave no sign it was picked up or finished.

NOW

it gets eyes when acknowledged, a pick while work runs, and a green check once everything has shipped.

03 / 06

Under the hood

Release changes

Close at release

WAS

each shipped delivery needed a manual close, and the train closed directly at install.

NOW

one reconciliation per release, keyed by {project, release, final SHA} in SQLite, closes every shipped delivery once; installed and backfill are recovery only.

Release inventory and evidence

WAS

membership and proof were rebuilt by hand at each close.

NOW

the inventory binds the shipped SHA to every nested delivery and its proof, and close evidence is checked at the shipped commit.

Review sees the shipped bundle

WAS

pre-merge candidates kept the target's stale Commander bundle, so correct web deliveries were rejected.

NOW

candidates regenerate committed output with the same script real merges use.

Fewer shared-file conflicts

WAS
parallel journey-registry edits collided on every merge.

NOW
merges keep disjoint registry entries by ID, and shared-file notices tell workers how to proceed without supervisor relay.

Nested-shell commit guard

WAS
wrapping a commit in `bash -c '…'` slipped past the worker commit-scope guard.

NOW
plain `-c` and `eval` are inspected with their effective directory, and other shell invocation forms fail closed.

Violet

WAS
uncertain posts could not always be reconciled, multi-part thread posts misreported success, and long managed threads lost mention authority.

NOW
posting includes outcome reconciliation, thread posts confirm every part, and failed claims record a coded blocker for the owner.

Coordination

WAS
a requested worker answer could be capped like routine status, and day-old transcript copies raised delivery alarms.

NOW
the first answer to an explicit ask wakes the supervisor, and only recent ask, blocker and answer copies alert, once per batch.

Reliable work setup

WAS
oversized overflow requests failed, new tasks could attach to a landed train, untouched resumed branches retained old bases, and clean navigation files blocked switching.

NOW
requests fit the peer limit, new work joins the successor, resumed untouched branches refresh their base, and clean navigation files remain switchable.

Honest commands and delivery alerts

WAS
derived-priority requests could silently keep the old value, check completions triggered redundant delivery alerts, and command assertions were mistaken for prose.

NOW
conflicting priority requests fail atomically with a reason, delivered check completions stay quiet, and tests can assert executable redirects directly.

Measurable quality and scoped notes

WAS
no per-supervisor release ledger exposed delivery counts and wake-source costs, and creating a permitted harness scratchpad could be refused.

NOW
the read-only quality ledger reports merged deliveries, changed safeguards and turns by wake source; the current session can create its own scratchpad.

Release receipt (relative to ~/.cas/artifacts): `release/v4.14.0-latency/release-latency.receipt`.

Pipeline latency

Stage timings are unavailable: the latency receipt records no STAGE_SECS.

No source warnings.

Validation: the merge queue proved the final release tree. No batch QA round ran on this candidate; this report does not claim independent batch journey coverage. Report rendering checks below validate this document only.

Timing endpoints: first child commit to main landing, 42,400 seconds against 1,800 (missed by 40,600); main landing at 7:54:35 PM ET to publication at 8:15:06 PM ET, 1,231 seconds against 1,200 (missed by 31). Queue green at 7:54:32 PM ET to publication, 1,234 seconds against 1,200 (missed by 34). One queue run. Per-stage, request and cut timings are unavailable.
