Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.78.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Sessions	3	Supervisor identity after `/clear`; No-op terminal resizing; macOS socket cleanup
Tasks	3	Closing batch-merged work; Review checkout retries; Origin-based merge advice
Messages	1	Wake measurements
Releases	2	Repository runner registration; Release copy validation
Slack and Cloud	2	Slack channel inventory; Pattern operation responses
Other	1	Consistent terminal wrapping
Total	12	6 areas

Source: CHANGELOG `CHANGELOG.md`, release-notes draft `docs/release-notes/2026-10-24-v3.78.0-slack.md`, GitHub `Richards-LLC/cassy` release v3.78.0; retrieved 24 October 2026 · 3:38 PM ET.

12

Changes shipped

1 added, 2 changed, 9 fixed; tests and docs not counted

14m 29s

Green to published

Over budget (10m 0s budget); Merge-queue CI completion to publication

> Changes and GitHub issues are counted separately. A change is one titled entry in the v3.78.0 CHANGELOG section; tests and documentation entries are listed under the hood but not counted. A GitHub issue counts when release PR #1361 or the CHANGELOG section references it and it closed between the PR opening (2:36 PM ET) and 15 minutes after its merge (3:35 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. The merge queue ejected the release PR once on two test-only failures; a test-only repair landed and the rerun passed. No other stage was blocked or needed manual intervention. Not measured for this release: request to published, cut to published, lesson recurrence.

What you can do now

Release changes

Slack channels

WAS

You couldn't see which Slack channels were linked to a project, or set up several together.

NOW

`cas violet channels` lists them, and `cas update` checks the channels you configured.

Uncertain pattern changes

WAS

A save or adoption could fail on the network after being sent, but look safe to repeat.

NOW

Cassy marks the result uncertain and shows how to check it before trying again.

Readable terminal output

WAS

Different commands wrapped long words and paths differently.

NOW

Terminal output follows one consistent rule, keeping a long path readable on its own row.

Smooth shared terminal views

WAS

A full-width view resizing without changing the layout, or taking input at the same size, briefly paused drawing for everyone.

NOW

Those actions keep drawing; compact views and real owner-size changes still refresh.

Under the hood

Channels and patterns

Multi-channel inspection

WAS

Projects declared one Slack channel, and existing links were difficult to inspect.

NOW

`cas violet channels` lists configured, Violet and Cloud links; `slack.channels` feeds multi-channel `cas update` checks.

Pattern response handling

WAS

Pattern reads assumed wrapped Cloud rows, and any transport error after create could imply an uncertain write.

NOW

Reads validate bare or wrapped rows; create/adopt writes are uncertain only after request-body transmission and retain the error plus reconciliation ID.

Task lifecycle

Merged task closes

WAS

Squash-merged work could be refused, and already-live changes could trigger a redundant QA pass.

NOW

Close proves tip containment plus target ancestry and skips independent QA for deliveries already on the target.

Origin-based merge advice

WAS

A merge using an origin-only successor told users to merge on their stale local branch, then push a rejected result.

NOW

Cassy says to fast-forward first; a divergent local successor keeps its own advice.

Supervisor identity after `/clear`

WAS

A Claude supervisor's cached identity could register a second row after `/clear`.

NOW

Session end preserves the live row, and session start rebinds it by process and name.

Operations and recovery

Wake measurements

WAS

Pasted-content and `Message from` wrapped turns with leading whitespace before the CAS envelope were missed by wake accounting.

NOW

Those bodies are trimmed before turn matching, so token and latency reports include them.

macOS socket cleanup

WAS

A refused connection could be mistaken for proof that a stream or datagram socket had no holder.

NOW

A complete native holder inventory and ownership/inode fences gate removal; unknown results preserve the path.

Review checkout durability

WAS

A failed directory sync left a fresh checkout that a retry reused without syncing.

NOW

New task and scratch parents sync before Git, and a failed sync removes only that fresh checkout.

Repository runner registration

WAS

Repository tokens were labelled as organization tokens and got an organization-only runner group.

NOW

Diagnostics distinguish token types and repository registration omits that group.

Terminal and release tooling

Consistent CLI wrapping

WAS

Initialization, activity, doctor and release reports handled overlong words differently.

NOW

A shared wrapper applies an explicit policy, with long initialization paths kept on their own row.

Factory viewer resizing

WAS

A non-owner Full→Full resize or same-size input takeover scheduled a 100 ms shared layout resize.

NOW

Only compact transitions or changed owner dimensions schedule that resize.

User announcement lint

WAS

Forbidden user wording was checked only in the User top-level post.

NOW

Validation checks both User bodies and leaves technical wording allowed in Dev.

Evidence and scope

Sources retrieved 24 October 2026, 3:38 PM ET: the CHANGELOG (https://github.com/Richards-LLC/cassy/blob/34f74a8ef6de70803b1f61aaa22108ceb0e11d62/CHANGELOG.md) and the release draft (https://github.com/Richards-LLC/cassy/blob/34f74a8ef6de70803b1f61aaa22108ceb0e11d62/docs/release-notes/2026-10-24-v3.78.0-slack.md), both as corrected after the tag (commit 34f74a8ef), and GitHub release v3.78.0 (https://github.com/Richards-LLC/cassy/releases/tag/v3.78.0). PR #1361 (https://github.com/Richards-LLC/cassy/pull/1361) opened at 2:36:12 PM ET and merged at 3:20:43 PM ET (44m 31s, including one merge-queue ejection on two test-only failures that was repaired before the rerun); publication completed at 3:34:56 PM ET, 14m 13s after the merge, and the release host installed it at 3:35:58 PM ET (59m 46s from PR opened).

Changes are grouped by title, then text. Moved by hand: No-op terminal resizing and macOS socket cleanup to Sessions (shared factory views and their sockets), Origin-based merge advice to Tasks (delivery merges), and Consistent terminal wrapping from Releases to Other (it covers every command, not only release output); the macOS title was recased. Counts describe changes, not impact.

Merge-queue green (3:20:27 PM ET) to publication took 869 seconds, over the 600-second budget. Published archives were downloaded fresh and matched GitHub's SHA-256 metadata before entering the draft; 3.78.0 is installed on the release host through `cas update`. Neither release PR #1361 nor the CHANGELOG section references a GitHub issue, so the fixes ledger is empty.

The GitHub release body was first built from an earlier CHANGELOG wording; it was updated after publication to match the corrected v3.78.0 section shown here (terminal resizing, pattern uncertainty after sending, session start after `/clear`, and wake leading whitespace).

Pipeline latency

Stage timings are unavailable: the latency receipt records no STAGE_SECS.

No source warnings.
