cas-src v3.68.0

RELEASE REPORT · PUBLISHED 20 OCTOBER 2026 · 9:54 PM ET

The hub keeps its setup, messages find their reader and reviews finish.

AREA	CHANGES
Commander	1
Sessions	1
Tasks	2
Messages	1
Releases	1
Safety	1
Other	1

8 changes shipped across 7 areas; Tasks has the most, 2.

One dot, one shipped change. No GitHub issues are counted in this report's fixes ledger.

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.68.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Commander	1	The macOS hub keeps its settings and restarts cleanly
Sessions	1	Dedicated-account connectors for workers
Tasks	2	Review and QA follow the delivery; QA field-report rules in the built-in skills
Messages	1	Messages and reminders reach the right session
Releases	1	Slack and release tooling
Safety	1	Credential guards close more bypasses
Other	1	Mac simulator checks no longer hold up other work
Total	8	7 areas

Source: CHANGELOG `CHANGELOG.md`, release-notes draft `docs/release-notes/2026-10-21-v3.68.0-slack.md`, GitHub `Richards-LLC/cassy` release v3.68.0; retrieved 20 October 2026 · 9:57 PM ET.

Changes shipped

6 fixed, 1 added, 1 changed; tests and docs not counted

15m 20s

Green to published

Over budget (10m 0s budget); Merge-queue CI completion to publication

> Changes and GitHub issues are counted separately. A change is one titled entry in the v3.68.0 CHANGELOG section; tests and documentation entries are listed under the hood but not counted. A GitHub issue counts when release PR #1325 or the CHANGELOG section references it and it closed between the PR opening (8:43 PM ET) and 15 minutes after its merge (9:54 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. No release stage was blocked. No manual interventions. Not measured for this release: request to published, cut to published, lesson recurrence.

02 / 06

What you can do now

Your hub stays put

Remembered sharing setting

WAS

restarting or updating could forget how your hub is shared on your network.

NOW

Cassy keeps your saved choice every time.

A clear sharing warning

WAS

when network sharing failed, the hub quietly stayed on this computer only.

NOW

you see a warning and the command for local use, and a Mac background start retries by itself.

Updates on a Mac

WAS

an update could leave the old hub running and needed a manual restart.

NOW

the update restarts the hub and checks that the new version is the one running.

Accurate hub status

WAS

status could say the hub had stopped while a new one was already running.

NOW

it reports the hub that is actually running.

Messages and reminders

Messages to a finished session

WAS
a message to someone whose session in another project had ended failed with "no one by that name".

NOW
it reaches whoever took over, or tells you the session ended.

Reminders after a shutdown

WAS
a reminder could get stuck when the session holding it shut down normally.

NOW
it is set to go off again.

Honest delivery logs

WAS
logs said a prompt was being sent even when it never reached the screen.

NOW
logs show whether it was actually typed and submitted.

Safety

Saved sign-ins stay private

WAS
a few unusual command shapes could still read saved sign-in files.

NOW
those shapes are checked and blocked.

Fewer false refusals

WAS
some harmless one-line lookups were refused.

NOW
they run when all they do is read.

Connected apps for a dedicated account

WAS
a session started under a dedicated account lost that account's connected apps, such as Gmail.

NOW
list the apps you approve for that account and only those load.

Reviews and reports

Steady screenshot reviews

WAS
adding a section to a page could flag existing visual issues as new.

NOW
each issue stays matched to the same element.

Reviews that finish

WAS
a review could stall after a failed check or skip a reviewer who was already waiting.

NOW
reviews recover cleanly and reuse the waiting reviewer.

Already-merged work

WAS
merging work that was already in place reported success and asked for another review.

NOW
Cassy says the work is already there.

Split work stays where it belongs

WAS
work promised to the other side of a split could still be handed out here.

NOW
it stays with that side unless a handover is approved.

Trustworthy proof

WAS
a closing comment could pose as attached proof.

NOW
only proof Cassy attached itself counts.

Large Slack files

WAS
a file too large for a Slack reply was refused only after other checks.

NOW
it is refused right away.

03 / 06

Under the hood

Hub lifecycle

Persistent transport mode

WAS
restart and update could lose the host's hub transport policy.

NOW
`cas hub restart` and `cas update` honor `auto`, `required` or `loopback` from `~/.cas/config.toml`; CLI flags override one launch.

Auto publication retries

WAS

an `auto` Tailscale Serve failure fell back to loopback silently.

NOW

interactive start/restart warn on stderr, and macOS service startup retries within a bound, then exits so launchd retries.

macOS update turnover

WAS

without procfs, a source update left the old hub running beside the new binary.

NOW

it runs `cas hub restart`, checks `cas --json hub status` for the new version and fails the update if restart fails.

Live lock owner

WAS

`cas hub status` trusted an exited process record over a live machine-lock holder.

NOW

the live holder leads the verdict; the stale record stays in JSON as history.

Delivery and reminders

Ended cross-project peers

WAS

ended sessions resolved only by exact name, so `project` and `project@machine` selectors failed.

NOW

they use the live-peer selectors, pick the latest match and still route through the successor check.

Held reminder shutdown

WAS

a normal worker shutdown could strand its held reminders.

NOW

shutdown re-arms them in order.

Submit receipts

WAS

"Injecting prompt" logged for an attempt whether or not the payload and submit landed.

NOW

Codex reminder and peer-reply logs separate the attempt from a confirmed payload write and submit.

Command safety

Credential guard round 5

WAS

`env -C`/`sudo -D` chdir prefixes, a separate `tar -f` value and clusters like `curl -sd@file` evaded the guard.

NOW

the wrapper chdir applies and each form's file operand is checked.

Nested substitution quotes

WAS

double quotes inside a `$(…)` within a double-quoted word broke tokenizing and refused read-only one-liners.

NOW

the substitution keeps its own quoting context for the effect collector.

Explicit-account connectors

WAS

strict MCP removed a dedicated config dir's claude.ai connectors.

NOW

an operator-provisioned `cassy-worker-connectors.json` admits exactly the named connectors with their tool-permission ceilings; default workers stay Cassy-only.

Review, QA and proof

Visual-QA pairing

WAS

findings keyed on `:nth-of-type` selectors re-keyed as introduced after an inserted section (GH #1321).

NOW

they pair on `#id`/`data-testid`, else a DOM path without positional pseudo-classes.

Merged review authority

WAS

a merged delivery refused by another gate got no dispatch, QA re-rounds ignored the idle reviewer and a failed parked verdict dead-ended.

NOW

dispatch is prepared, idle reviewers are reused, the first verdict binds and blocked parked reviews recover.

Merged-content refusal

WAS

a pending dispatch could mask a dropped-content refusal on the next close.

NOW

the read-only integration gate runs first; passing still needs that dispatch's verdict.

Contained merges

WAS

`worktree_merge` of an already-merged old tip reported success and opened a verification dispatch.

NOW

it reports the contained source before close and verification, rechecking after origin reconciliation.

Split takeovers

WAS

assignment could bypass an accepted split and take a child on the peer supervisor's side.

NOW

a takeover grant from the current task snapshot authorizes exactly one assigned worker.

Trusted note markers

WAS
close/cancel/reopen/request_changes reasons appended verbatim could plant an `ARTIFACT_PROOF:` line.

NOW
the timeline is an untrusted sink; markers need a trusted append and rendered provenance, and survive reordering.

Tooling

Managed reply size

WAS
the 1 MiB managed-reply file check ran after the publication gate.

NOW
it runs before the gate.

Announcement body edges

WAS
validation and posting could normalize fenced body edges differently.

NOW
both share one normalization.

Simulator ownership on macOS

WAS
ownership-probe waits ran on the async runtime.

NOW
they run on the blocking pool, with cross-process checkpoint coverage restored.

QA field-report skills

WAS
QA, TDD, supervisor and worker skills lacked the field-report rules.

NOW
they cover entry-path enumeration, system-of-record read-back, build mapping, combination tables, red-first regressions and pre-respawn handoffs.

Fixes ledger
