What you can do now

02 / 06

Sending

Held messages go out after reconnect

WAS if the machine came back mid-send, a held message could sit unsent with nothing trying it again. →

NOW it goes out promptly once Commander reconnects, exactly once.

No Retry while another tab is sending

WAS with two tabs open, "Retry" could flash in one tab while the other was still sending, inviting a double send. →

NOW both tabs wait for that send to confirm, and a new reply no longer cuts the wait short.

Polish

Long machine names read in full on phones

WAS a long machine name was cut off beside its codename. →

NOW the name gets its own row and reads whole, and the codename steps aside when space runs out.

Stop result stays in view

WAS after Stop, the result line could scroll out of sight. →

NOW it stays on screen beside the next row, and the confirmation says the task goes back to Open.

Revoking says what happened

WAS revoking this browser's own access dropped you on a silent first screen. →

NOW Commander says the access was revoked and puts you on Pair a machine.

Plain words for browser problems

WAS a blocked permission or an unsupported browser read "Can't reach". →

NOW it reads "Blocked by browser" or "Browser can't connect".

Keyboard reaches Interrupt quickly

WAS Interrupt was about a dozen Tab presses from search. →

NOW "Skip to the conversation" gets you there in three keys, with a ring at every stop.

Pinned bar readable on hover in dark

WAS hovering the pinned question bar in dark turned it navy under dark text. →

NOW it keeps its amber fill and only lifts.

Assign names its task

WAS the Assign picker showed only the task's ID. →

NOW it names the task by its title.

Landscape refusals stay in view

WAS on a phone held sideways, a refusal in Tasks & progress landed below the fold. →

NOW it rides the bottom edge of the sheet.

Undo dismiss says what happens

WAS dismissing the phone Undo offer gave no hint where Undo went. →

NOW the dismiss button says Undo stays in Tasks & progress, and it does.

Lighter pairing buttons

WAS in light, the pairing dialog's button bar read as a whiter slab. →

NOW it is part of the sheet and frosts only while fields scroll beneath it.

Answers minutes apart get their own time

WAS replies minutes apart merged under one time. →

NOW a five-minute gap starts a new group with its own time, and reload keeps the grouping.

Clearer during an outage

WAS a reload mid-outage read "0 conversations" and the banner covered the thread's top. →

NOW it reads "Conversations not loaded yet" and the banner sits above the thread.

Who is in control

WAS you learned another device held control only by trying to take it. →

NOW the header names that device, and a refusal says how to get past it.

Plainer pairing

WAS the admin permission showed its raw code and every browser had the same default name. →

NOW it reads "See and revoke other browsers on" the machine, and a browser is named like "Chrome on Linux".

Commander send fixes, polish and journey tooling

Held-send wake coalescing	WAS HeldSendFlushes returned early while a batch held the key, so a Live callback during a definite no-write settlement was lost and the message stalled. → NOW a mid-batch call marks the batch to rerun with the latest work, the journal still gates every write, and uncertain or revoked claims never replay.
Peer receipt deadlines	WAS a tab projecting another tab's durable sending claim marked it unconfirmed at once and showed Retry. → NOW it keeps the claim's original 15 s receipt clock, and the journal refuses to re-hold an active peer claim even from a stale Retry.
Peer clocks ignore local replies	WAS a reply landing in one tab applied the 5 s reply grace to a peer's send. → NOW restored projections keep the original timeout, a lost dispatch claim reads durable state instead of unconfirming, and history settles restored sends as one row.
Phone header and Stop result	WAS the phone identity shared a row with the actions, so names truncated beside the codename. → NOW identity has its own row, the machine never shrinks while the codename shows, and Stop scrolls its result into view.
Browser-side status	WAS blocked permission and unsupported browser fell through to "Can't reach", and one session's retry set the machine footer to Reconnecting. → NOW BROWSER_BLOCKED and BROWSER_UNSUPPORTED labels reach header, row, footer and launch sheet, and the footer ignores a sibling retry.
Keyboard, control and pairing copy	WAS Interrupt was 12 Tabs from search, control holders were hidden, and pairing showed raw scope ids. → NOW a skip link, a header control line, plain admin consent, a browserLabel default name and aria-labelledby on every pair dialog.
Thread time groups and kept replies	WAS turns minutes apart merged under one time, and a journal-restored reply's stored time posed as a machine stamp. → NOW GROUP_SPLIT_MS splits on a five-minute gap, and kept replies take the machine stamp once history arrives.
Glass details	WAS the pinned bar lost its amber on hover in dark, the rail sliced rows at its corners, and the pair action bar frosted into a slab. → NOW hover keeps the ask fill, rail edges fade only with rows beyond, and the bar frosts only over scrolled fields.

Fleet sheet details	WAS the Assign picker showed only an id, a landscape refusal fell below the fold, and dismissing Undo was ambiguous. → NOW the picker names the task title, the notice is sticky at the sheet's bottom, and the dismiss label says Undo stays.
Journey selection at the reviewed head	WAS the close gate and journey-receipt.py ran journeys-for-diff.py from the shared checkout, whose older copy could ignore CAS_JOURNEYS_HEAD. → NOW both run the selector blob from the reviewed head over stdin and refuse proof if it is missing or broken.
