Cassy v3.81.0

RELEASE REPORT · PUBLISHED 26 OCTOBER 2026 · 1:02 PM ET

Reviewed changes finish with fewer handoffs.

AREA	CHANGES
Sessions	1
Tasks	7
Messages	1
Releases	2
Safety	1

12 changes shipped across 5 areas; Tasks has the most, 7.

One dot, one shipped change. No GitHub issues are counted in this report's fixes ledger.

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.81.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Sessions	1	Stale merge and blocker alerts
Tasks	7	Closing merged deliveries after review; Merge on green; Merge readiness probes; Close proof on shared delivery branches; Consistent post-merge close evidence; Released epic review boundary; Terminal QA regression selection in CI
Messages	1	Remote completion reminders
Releases	2	Reclaiming removed checkouts' build caches; Builtin install-parity test isolation
Safety	1	Operator credential-store access
Total	12	5 areas

Changes shipped

1 added, 2 changed, 9 fixed; tests and docs not counted

17m 8s

Green to published

Over budget (10m 0s budget); Merge-queue CI completion to publication

Changes and GitHub issues are counted separately. A change is one titled entry in the v3.81.0 CHANGELOG section; tests and documentation entries are listed under the hood but not counted. A GitHub issue counts when release PR #1374 or the CHANGELOG section references it and it closed between the PR opening (12:08 PM ET) and 15 minutes after its merge (1:00 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. The standalone timing receipt has no train-stage or intervention history. The release-host record reports one queue ejection around 16:25 UTC, followed by repair 1c5416825; the exact delay is unmeasured. Not measured for this release: request to published, cut to published, lesson recurrence.

What you can do now

Release changes

Finishing reviewed changes

WAS

A merge and passing review could still need another close request.

NOW

Eligible merged changes finish automatically, while a failed review returns its findings for correction.

Ready sooner

WAS

Pushed changes with passing checks could wait for an extra handoff.

NOW

They signal readiness as soon as the evidence is available, while review and check requirements still apply.

Quieter readiness checks

WAS

Unchanged ready changes kept causing repeat checks, and a restart could repeat the notice.

NOW

Readiness is remembered across restarts, with failed checks revisited after 10 minutes and temporary lookup failures retried.

Latest fix recognized

WAS

Finishing a change could check its first failing attempt instead of the pushed fix.

NOW

Clearly identified follow-up commits are checked through the pushed fix.

Consistent finish checks

WAS

Automatic finishing could miss passing evidence that a manual close could see.

NOW

Both use the same delivery evidence; other unmet requirements remain visible and an unsuccessful close keeps its hold.

Saved service access

WAS

The main session could be refused access to its saved Neon and Vercel sign-ins.

NOW

It can read those recognized stores, while unrelated secrets and restricted background access stay protected.

Relevant alerts

WAS

Already merged changes could still prompt a merge, and an existing review wait could trigger another blocker alert.

NOW

The merge target is checked again before delivery, and a review wait already owned by its recipient stays quiet.

Disk space recovery

WAS

Old build caches could survive a removed checkout and keep blocking new builds.

NOW

Proven idle caches are reclaimed oldest first until enough space is free, while live work remains protected.

Reliable install checks

WAS

A personal custom command could change the result of a clean-install check.

NOW

That check runs with an isolated home, while your personal command keeps its usual priority.

Stable release review

WAS

Later unrelated changes could shift the revision checked for a released group of work.

NOW

The review stays tied to the merge that actually released it.

Completion across machines

WAS

A remote completion or an ended session could leave a wait unnoticed.

NOW

Saved completion is checked directly, the final completion sends a readiness notice, and a wait whose task is cancelled, or whose deadline passes first, notifies its owner.

Terminal check coverage

WAS

Changes to terminal capture checks could miss their regression tests in lighter CI runs.

NOW

Changes to either copy or its tests select the terminal test suite there too.

Under the hood

Release changes

Merge-bound close

WAS

A pushed delivery could require another close request after merge and review.

NOW

A green merge can park an eligible pushed tip and dispatch review at the merge; approval closes it, rejection returns findings. Explicit CI overrides do not authorize automatic close.

Green delivery signal

WAS

Readiness depended on park or a merge request.

NOW

An owned pushed-green tip signals READY TO MERGE even when park was refused; required CI and QA admission still apply.

Probe reuse

WAS

Readiness and wait reporting fetched separately, repeated settled probes, and forgot READY admission on restart.

NOW

One observation feeds both paths; per-task/tip receipts survive restart, failed CI retries after 10 minutes, transient evidence remains retryable, and terminal tasks' READY receipts and cached observations for those deliveries retire.

Shared-branch close anchor

WAS

A failing-first commit could remain the proof boundary after a pushed fix.

NOW

Active shared-branch continuations advance it only when every commit subject names the same task and no conflicting delivery boundary intervenes.

Receipt parity

WAS

Automatic close read evidence from a different checkout and could record close authority before success.

NOW

It reads exact-tip receipts from the delivery checkout, restores a held close, and records authority after commit. Parking requires local-branch and origin evidence and sends one notice.

Credential access scope

WAS

The operator-store guard also refused privileged and ordinary primary sessions.

NOW

Nonrestricted sessions can read recognized Neon/Vercel stores; the generic exemption checks only the protected read operand, preserving unrelated secrets, writes and explicit protection.

Alert freshness

WAS

Codex PTY merge alerts could outlive their target evidence, and owned verification waits could wake their recipient twice.

NOW

PTY delivery refreshes the target like native-inbox delivery; positively identified sole-owned active review waits become quiet receipts. Independent blockers remain waking.

Target-cache reclamation

WAS

Removing a checkout could hide its dead build cache from automatic reclamation.

NOW

Durable ownership survives removal; pressure cleanup deletes eligible caches oldest first and remeasures actual capacity to the low threshold. Budgeted reports mark incomplete inventories.

Hermetic parity fixture

WAS

A host's personal Codex finish skill changed the clean-install catalog count.

NOW

The existing regression uses an isolated home and names the failing client; runtime personal-skill precedence is unchanged.

Immutable release boundary

WAS

A release close dispatch followed the moving default branch and accepted later containing merges.

NOW

It binds the introducing merge SHA, rejects receipts whose first parent already contains the released tip, and bounds the first-parent walk by that tip's ancestry.

Remote task waits

WAS

Synced closes lacked a local event, finite defaults could expire long waits, and an orphan could stop a reminder pass.

NOW

Persisted task states drive waits; filtered waits default to no expiry, a cancelled watched task or a passed explicit deadline notifies the owner, rows reconcile independently, and final split completion routes readiness to a live successor.

Terminal QA in CI

WAS

The terminal Node suite had no changed-input route in lightweight CI.

NOW

Either runner copy or its test selects it; normal fast rows and the slim workflow each run their own applicable path once, with empty/zero-base fallback.

Evidence and scope

Retrieved 2026-10-26 at 13:06 ET. Sources linked beside the change map are the v3.81.0 CHANGELOG, the release draft on main and the published GitHub release. Areas follow the generator's classification; none were regrouped.

PR #1374 (https://github.com/Richards-LLC/cassy/pull/1374) opened 16:08:16Z and merged 16:45:27Z on 2026-10-26. The issue-counting window ends 15 minutes later, at 17:00:27Z. References in that PR and CHANGELOG yielded zero qualifying closed issues; no manual adjustment was made.

Queue CI 40360038046 (https://github.com/Richards-LLC/cassy/actions/runs/40360038046) completed at 16:45:04Z. Release run 40362172105 (https://github.com/Richards-LLC/cassy/actions/runs/40362172105) started at 16:45:30Z. Publication at 17:02:12Z followed queue green by 1,028 seconds, exceeding the 600-second budget. This measures queue-green to publication, not tag latency. PR to merge: 37m 11s; merge to publication: 16m 45s; PR to publication: 53m 56s.

The published commit is d86cf0423. Both archives were freshly downloaded; their full digests matched GitHub metadata. The task cas-e89c release-host record reports installation on soundwave at 17:02:31Z, 19 seconds after publication and 54m 15s after PR opening. This worker did not inspect that host.

The GitHub release body was checked on 2026-10-26: it correctly limits retirement to terminal tasks' READY receipts and cached observations for those deliveries, and reminder notice to a cancelled watched task or an explicit deadline passing while unfinished. Its timer footer still says 17:02:03Z and installation pending; the publication metadata and measured endpoints above take precedence.

Timing proof is the standalone latency/release-latency.receipt in task cas-e89c's artifact record. It has no stage breakdown or intervention history. The release-host record reports one queue ejection around 16:25Z and repair 1c5416825; exact delay is unmeasured. Request-to-publication, cut-to-publication and lesson recurrence are unavailable. Real before/after capture pairs were unavailable for these runtime changes.
