What you can do now

02 / 06

Slack mentions wake Cassy, files by path, steadier task closes

@Violet mentions wake Cassy

WAS when someone mentioned @Violet or replied in a thread Violet started, nothing happened until Cassy next checked Slack. →

NOW Cassy wakes on it within about 15 seconds and keeps reading that channel every 5 minutes until an hour passes with no one talking. It is on by default but stays quiet until the Slack side starts sending these alerts; `cas config set slack.wake_enabled false` turns it off.

Post a file by its path

WAS sharing a local file in Slack through Cassy meant copying its contents into the message by hand. →

NOW `cas violet post --channel <name> --file <path>` posts it, and `cas violet thread` posts a message with its replies and attachments in one go.

Share a published report by name

WAS getting a published Cassy report into Slack meant downloading it and uploading it again. →

NOW Cassy sends it straight from its id and checks the file arrived unchanged.

Violet's new address

WAS Violet settings pointed at the old hub address and used the old MECHA_ key names. →

NOW `cas update` and `cas integrate violet` move them to the new address and VIOLET_ names; the old names keep working for one more release.

Several closes at once

WAS closing a few tasks at the same time could freeze Cassy for most of a minute and then answer "unknown".
→

NOW closes run side by side, and one that runs long records its result when it finishes.

Healthy sessions left running

WAS on a busy machine Cassy could mistake a session it had just started for a broken one and shut it down. →

NOW freshly started sessions are recognised and left alone.

Database times in the right zone

WAS times read from a Neon or Postgres database could come back shifted by your time zone, so 14:34 read as 18:34. →

NOW they come back exactly as stored.

Keyboard focus stays put in Commander

WAS in a Commander conversation, a live update could knock keyboard focus off the page while you tabbed to Interrupt. →

NOW focus stays on the control you moved to, with its focus ring.

Clearer setup checks

WAS `cas doctor` said to re-run Violet setup when a project settings file was hiding a missing key, which never fixed it.
→

NOW it names that file and the block to remove.

Under the hood

03 / 06

Violet

Push-wake, on by default

WAS an @Violet mention or a reply in a Violet thread surfaced only when someone polled the channel. →

NOW a logged-in factory daemon claims the project's `violet.slack_activity/v1` events from Cloud every 15 s, admits each once by `dedupe_key`, acks it and wakes the supervisor with a typed `SlackActivity` envelope; a no-op until the hub emits events. Opt out with `slack.wake_enabled=false`.

Channel watch

WAS after one wake nothing re-read the channel. →

NOW each admitted channel is swept with `violet_read` every 5 min, stopping after 1 h without human activity, 3 failed reads or session end; `slack.violet_bot_user_ids` seeds the bot ids sweeps ignore.

cas violet post thread read	WAS posting a local file meant pasting base64 into violet_post. → NOW the CLI reads, hashes and encodes files from disk, sends up to 1 MiB inline and streams larger sets via file_external begin, upload, complete; thread is one kind: "thread" call with ordered --reply/--reply-file, and hub error codes pass through with a non-zero exit.
Artifact post	WAS a published artifact had to be downloaded and re-uploaded by hand. → NOW artifact action=post resolves it through Cloud, verifies size and SHA-256, uploads through Violet and saves the permalink on the record; every failure is named.
violet-hub address and VIOLET names	WAS managed registrations kept the former hostname and MECHA_* names. → NOW update/sync rewrite proxy files to violet-hub.vercel.app and VIOLET_* in place, cas integrate violet renames credential keys (0600, values never printed), and lookup falls back to MECHA_* for one release.
Skill contract	WAS the violet skill described the pre-2026-10-09 violet_post and violet_read shapes. → NOW it documents files[], file_external, kind=thread, the 100,000-byte read default and file_id/message_id/thread_id scopes, the attachments read route and the human-handoff rule.

Close and QA gates

No-code close	WAS a no-code task without its own commits was judged on the worker lane's other-task commits, so it read as stranded or parked. → NOW it closes on its external_ref, foreign anchors are ignored, and a lane is foreign only when every unmerged commit names another task.
Batch-squash receipts	WAS a commit_receipt naming a multi-task squash charged every sibling's paths to the closing task. → NOW QA judges the delivery anchor's own paths when the squash carries all of them.
Fresher verification target	WAS resolve_target_branch_ref bound a local target ~1000 commits behind origin. → NOW it binds origin/<target> when local is a strict ancestor; equal, ahead or diverged local still wins.
Close off the async runtime	WAS synchronous close work pinned a tokio worker, so parallel closes serialised and timed out as UNKNOWN at 55 s. → NOW close runs on the blocking pool with the caller's prefix and receipt scope; a late close answers IN_PROGRESS and appends CLOSE_OUTCOME, and an exact receipt replay returns the persisted boundary.
Snapshot and visual QA	WAS a shared change needed one approval note per snapshot line, a translated finding read as new, and placeholder-hidden loading text was flagged invisible. → NOW file-sha256:<digest> approves a whole file, pure translations pair, rejections always record, and a marker-hidden painted placeholder is exempt.

Factory and runtime

Delivery watchdog	WAS PTY echo of injected text grew pane output, so a swallowed message read as delivered. → NOW the watchdog reads the recipient's transcript for a turn start, nudges once and then flags nudge_failed.
MCP start-up	WAS a pre-initialize server/discover probe made cas serve exit, and on macOS the dead child pid got a healthy worker killed; a failed start-up hung on stdin. → NOW the probe gets -32601, a live fingerprinted harness parent keeps the worker alive, and failed start-up exits within 2 s.
Launch canary floor	WAS the canary floor was stamped after finish_worker_spawn, 0.8–19 s late, so fresh canaries were rejected and healthy workers killed. → NOW the floor is taken before the PTY starts.
Codex model preflight	WAS a Codex worker could spawn on a model its ChatGPT account cannot run and look busy. → NOW spawn refuses it from models_cache.json, and a provider model refusal is fatal, relayed as a blocker and shown as stalled.
Task-store locks	WAS every store open took the write lock and sync loaded the task under it, a lock inversion that stalled 31.6 s. → NOW opens write only when repair is needed, the sync queue has a busy timeout, and the task loads before the lock.
Postgres UTC	WAS mcp-server-neon serialised naive timestamps in the host zone with a Z suffix. → NOW Neon and server-postgres stdio children run with TZ=UTC unless their env sets TZ.
Commander focus	WAS a deferred render's microtask flush ran mid-Tab and a closed palette left a stale shell signature, so a hub update rebuilt the shell and focus fell to body. → NOW the flush waits a task, the palette adopts the closed signature and focus returns with its ring.
Doctor	WAS a missing upstream credential got generic integrate advice even when a project proxy.toml block shadowed it, and a bad violet_post schema went unnoticed. → NOW doctor names the shadowing block, flags a violet_post schema with a top-level anyOf or missing kinds, and states bearer readiness.
