Cassy v3.84.0

RELEASE REPORT · PUBLISHED 27 OCTOBER 2026 · 3:36 PM ET

Every subscription is listed by email, and the one with room is picked for you.

AREA	CHANGES
Commander	1
Sessions	11
Safety	1

13 changes shipped across 3 areas; Sessions has the most, 11.

One dot, one shipped change. No GitHub issues are counted in this report's fixes ledger.

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.84.0 CHANGELOG. Dots count changes, not their size or importance. Every session starts on a Claude or Codex account, so the account changes sit under Sessions.

AREA	CHANGES	WHAT CHANGED
Commander	1	Browser tests on Playwright 1.64.1
Sessions	11	One account list; Pickers name accounts by email; A recommended account; Remove, rename, disable and enable; A new login leaves nothing behind; Reset times in your local time; Shared settings repaired; A worker at its usage limit moves to the next account; Folders named old or backup are listed; Reset times in the JSON output of cas limits; Remove works on older hosts
Safety	1	Mac usage read from the Keychain
Total	13	3 areas

Changes shipped

8 added, 3 changed, 2 fixed; upgrade notes, tests and docs not counted

16m 14s

Green to published

Over budget (10m 0s budget); Merge-queue CI completion to publication

Changes and GitHub issues are counted separately. A change is one titled entry in the v3.84.0 CHANGELOG section; tests and documentation entries are listed under the hood but not counted. The two upgrade notes tell you what to do after installing; they describe changes already counted, so they add no dots. A GitHub issue counts when release PR #1399 or the CHANGELOG section references it and it closed between the PR opening (2:58 PM ET) and 15 minutes after its merge (3:34 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. No release stage was blocked. No manual interventions. Not measured for this release: request to published, cut to published, lesson recurrence.

What you can do now

Your accounts in one place

One list

WAS

There was no single view of your subscriptions and their usage.

NOW

`cas accounts list` shows every Claude and Codex account by email, with its plan, usage, reset times and any problem such as a duplicate or a login that no longer works.

Names you recognise

WAS

The pickers showed folder names like `main` and `alt`, and two folders with one login looked unrelated.

NOW

Rows show the email and folder name, and the original is listed before its copies. Your old names still work.

A recommended account

WAS

You had to remember which account still had room.

NOW

The account that resets soonest with room left is marked "recommended" with its reason, and the cursor starts on it. You can still pick any account, and nothing starts until you press Enter. Commander's New session sheet does the same.

Reset times you can plan around

WAS

Usage showed only a percentage or "in 6h".

NOW

Everywhere usage appears, it reads like "resets Tue 14:00 (in 6h)" in your local time, with the date for later days.

Tidy up

WAS
A mistyped or retired account folder could not be removed.

NOW
`cas accounts remove`, `rename`, `disable` and `enable` manage them. Your main account and accounts in use are protected, and removing asks first.

Clean new logins

WAS
A cancelled or failed login left an empty folder that looked like an account.

NOW
A new login only becomes an account when it succeeds.

Work keeps going

WAS
A background session that hit its usage limit stopped until someone moved it by hand.

NOW
It restarts once on the next recommended account and carries on with its task. If none has room, you are told when one will.

Mac usage

WAS
Claude usage on a Mac could show nothing.

NOW
It reads the login from the Mac Keychain.

After installing

Restore shared settings

WAS
Account folders recreated after linking lost their shared settings.

NOW
Run `cas doctor --fix` once after installing to restore them.

Removal is final

WAS
There was no way to remove an account.

NOW
Removing one deletes it after you confirm; there is no backup copy.

Backup folder names

WAS
An account folder whose name ended in a word like backup or old was hidden.

NOW
It counts as an account. To keep a backup hidden, end its folder name with .backup after the account name.

Under the hood

Account registry

Shared read model

WAS

Claude and Codex pickers each scanned their own config folders separately.

NOW

One registry returns provider, folder, email, plan, login state, structured usage windows and flags (`duplicate_of`, `never_logged_in`, `stale_login`, `disabled`) under one 4-second deadline. Identity is a typed object.

Name resolution

WAS

An unknown launch name created a new folder.

NOW

Launch and spawn resolve aliases, emails and symlinked folders through the registry. Unknown names are refused with the login command, and ambiguous emails list their aliases.

Selection policy

WAS

There was no shared recommendation.

NOW

One selection function honours `accounts.selection` and `accounts.threshold` (default 90); idle windows count as unused, reset-unknown ones rank last, and excluded accounts carry reasons. Pickers, Commander and `spawn_workers` without `config_dir` use it.

Lifecycle

WAS

Account folders had no lifecycle commands.

NOW

`cas accounts remove|rename|disable|enable`. In-use checks read live process environments and registered agents, including on older Cassy databases. Logins are staged in a hidden temp folder, symlink aliases follow their physical account, and `accounts.disabled` stores the canonical path.

Limit recovery

WAS

Limit evidence produced no account switch.

NOW

One durable episode per limit queues one switch to the next recommended account and keeps the worktree, branch and task. A failed switch still sends one fallback notice naming the error. The "no eligible account until" time is the earliest real eligibility. The supervisor is never switched.

Reset display

WAS

Reset text was relative or locale-dependent.

NOW

One `format_reset` gives local `resets Tue 14:00 (in 6h)` and `(in 1d 23h)`, and `--compact` stays one line with `+N more`. `cas limits --json` `reset_at` is now a zoned RFC 3339 timestamp.

macOS Keychain

WAS

Claude usage read only the credentials file in the account folder.

NOW

It reads the account's Keychain item first, keyed by the NFC-hashed config selector, and never prints it.

Doctor and launch links

WAS

Link drift after `cas accounts link` went unnoticed.

NOW

`cas doctor` reports account link drift, `--fix` repairs it with a backup, and launches restore the chosen account's shared links.

Tooling

WAS

Commander browser tests ran on Playwright 1.63.

NOW

They run on Playwright 1.64.1.
