cas-src v3.79.0 RELEASE REPORT · PUBLISHED 25 OCTOBER 2026 · 5:07 PM ET

Cassy 3.79 ends a stuck Mac session cleanly and recovers the helpers it left behind.

AREA	CHANGES
Sessions	6
Tasks	4
Other	1

11 changes shipped across 3 areas; Sessions has the most, 6.

One dot, one shipped change. 2 GitHub issues closed with this release, listed in the fixes ledger. See every change ↓

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.79.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Sessions	6	Clearing a session whose PID was reused; Factory daemon wedged on worker shutdown (macOS); `cas kill` on a stuck or dead daemon; Workers stranded by an unresponsive supervisor; Shared terminal layout with a compact input owner; macOS socket cleanup diagnostics
Tasks	4	Concurrent close conflict; Close notes during concurrent edits; Faster close proof checks; Review checkouts through symlinked paths
Other	1	Terminal QA captures
Total	11	3 areas

Changes shipped
1 added, 10 fixed; tests and docs not counted

2
GitHub issues closed
Closed from PR #1364 opening to 15 min after merge

3m 57s
Green to published
Within budget (10m 0s budget); Merge-queue CI completion to publication

> Changes and GitHub issues are counted separately. A change is one titled entry in the v3.79.0 CHANGELOG section; tests and documentation entries are listed under the hood but not counted. A GitHub issue counts when release PR #1364 or the CHANGELOG section references it and it closed between the PR opening (4:43 PM ET) and 15 minutes after its merge (5:19 PM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No release stage was blocked. No manual interventions. Not measured for this release: request to published, cut to published, lesson recurrence.

02 / 06

What you can do now

Release changes

Stuck sessions on Mac

WAS

A session could go silent while stopping its helpers, with nothing in its log.

NOW

Each helper gets 15 seconds to stop; a stall is logged and a session still stuck 20 seconds after a stop request exits.

`cas kill` clears dead sessions

WAS

`cas kill` could fail to end a stuck session or leave its helper processes running.

NOW

It force-stops a stuck session only when sure it is the right process, then cleans up its helpers.

Reused process IDs

WAS

A session whose process ID now belonged to another program could not be cleared.

NOW

`cas kill <name> --force-stale` shows what that ID runs, asks first, and clears the session without touching that program.

Taking over from an unresponsive session

WAS

After another session took over the work, messages and reset or stop requests still went to the unresponsive one.

NOW

They reach the session that took over, which can reset or stop the stranded helpers.

Closing tasks

WAS

A close running alongside another, or with a note added mid-close, could fail with an unclear message.

NOW

Cassy names the close already in progress, keeps notes and retries a note-only race; proof checks also run faster.

Shared terminal views

WAS

Some views missed a layout refresh when a compact screen held input.

NOW

The layout refreshes whenever input moves to or from a compact screen, or a full view resizes.

03 / 06

Under the hood

Daemon shutdown and cas kill (GH #1363)

Bounded worker teardown

WAS

A shutdown's per-worker kill and pane drop ran on the daemon loop and could wedge it silently.

NOW

Each runs off-loop with a 15 s deadline that logs the stalled stage and process group; a persisting wedge re-reports every 30 s and exits 20 s after shutdown.

Daemon exit and logging

WAS

An exited daemon could wait forever on a stuck teardown thread, and the daemon log missed lifecycle events.

NOW

Runtime shutdown waits at most 5 s; the daemon log records start, stop and exit.

cas kill escalation and reaping

WAS

SIGTERM could be ignored, SIGKILL could orphan worker groups, and an unreadable start time read as dead.

NOW

SIGKILL needs an exact start-time match; fingerprint-checked worker groups are reaped from the daemon's recorded store only on certain death.

--force-stale

WAS

A session whose recorded PID ran another program could not be cleared.

NOW

`cas kill <name> --force-stale` prints the PID's command, confirms, pins PID and start time, never signals it, reaps workers and drops the record.

Supervisor adoption (GH #1362)

Stranded workers

WAS

After epic adoption, target=supervisor routed to the dead supervisor, and reset and shutdown refused from the adopter.

NOW

With a live epic_verification_owner and a fingerprint-confirmed dead daemon, routing follows the adopter and reset and shutdown work there.

Adopted worker shutdown

WAS

A retired adopted orphan blocked later shutdown_workers, and escaped child processes survived.

NOW

Retirement is idempotent and shutdown checks the recorded group plus each captured descendant fingerprint.

Task close

Active dispatch conflict

WAS

A racing close failed with a generic "different verification proof boundary" error.

NOW

The store returns the exact active dispatch, and close names it plus whether boundary, owner or requester differs.

Close notes

WAS

The close note merge assumed append-only notes, and a note written in the pre-write gap refused the close.

NOW

Rewritten notes are preserved and a note-only race retries.

Close proof scan

WAS

Proof-input checks ran git per directory level and per candidate file and knew only the shortest ../ include spelling.

NOW

One delivered-tree scan per commit is shared across worktrees; the batched source read streams so large trees cannot deadlock, and any ../ spelling resolves.

Terminal and tooling

Compact-owner resizing

WAS

The 3.78 no-op resize skip also skipped needed layouts when a Compact client owned input.

NOW

Full viewer resizes under a Compact owner and same-size takeovers to or from Compact reschedule the layout.

terminal-qa carriage returns

WAS

CR redraws and CRCRLF line ends dropped visible row text while reporting PASS.

NOW

CR resets the cursor and overwrites cells in place, and erase-in-line controls apply.

Review checkouts and socket logs

WAS

Symlinked CAS roots hid managed review checkouts, and macOS socket retention was unexplained.

NOW

Roots are canonicalized and each kept socket path logs its reason at debug level.

Evidence and scope

Sources retrieved 25 October 2026, 5:12 PM ET: the CHANGELOG (https://github.com/Richards-LLC/cassy/blob/015f005c2ad9e88ec04b775a1e6c693df9aa5917/CHANGELOG.md) and the release draft (https://github.com/Richards-LLC/cassy/blob/015f005c2ad9e88ec04b775a1e6c693df9aa5917/docs/release-notes/2026-10-25-v3.79.0-slack.md), both as corrected after the tag (commit 015f005c2), and GitHub release v3.79.0 (https://github.com/Richards-

LLC/cassy/releases/tag/v3.79.0). PR #1364 (https://github.com/Richards-LLC/cassy/pull/1364) opened at 4:43:42 PM ET and merged at 5:04:00 PM ET (20m 18s, with no merge-queue ejection); publication completed at 5:07:43 PM ET, 3m 43s after the merge, and the release host installed it at 5:08:41 PM ET (24m 59s from PR opened).

Changes are grouped by title, then text. Moved by hand: Shared terminal layout with a compact input owner from Other to Sessions (shared factory views, as in 3.78), and Terminal QA captures from Tasks to Other (a terminal capture tool, not task delivery); the macOS title was recased. Counts describe changes, not impact.

Merge-queue green (5:03:46 PM ET) to publication took 237 seconds, within the 600-second budget. Published archives were downloaded fresh and matched GitHub's SHA-256 metadata before entering the draft; 3.79.0 is installed on the release host through `cas update`. GitHub issues #1362 and #1363 were closed as fixed in 3.79.0 inside the counting window.

The tag holds an earlier CHANGELOG wording for three claims; the CHANGELOG and draft were corrected after publication, and the GitHub release body was updated to match the corrected section shown here (the `--force-stale` refusal condition, the factory socket path and the streamed batched source read).

Pipeline latency

Stage timings are unavailable: the latency receipt records no STAGE_SECS.

No source warnings.
