Cassy v3.98.0

RELEASE REPORT · PUBLISHED 2 NOVEMBER 2026 · 3:09 AM ET

One release verdict closes the finished work, test builds run on request, and session dots show three clear states.

One dot, one shipped change. No GitHub issues are counted in this report's fixes ledger.

Release at a glance

▼ What shipped, by area

One dot is one change listed in the v3.98.0 CHANGELOG. Dots count changes, not their size or importance.

AREA	CHANGES	WHAT CHANGED
Commander	3	Session dots follow three states; Dismissed sessions stay reachable; Restore holds on the browser that dismissed
Sessions	3	Attribute background CPU to the job; Keep healthy background work busy; Quiet repeated planning
Tasks	11	Tier 1 deliveries close on one release verdict; The verdict closes its Tier 1 deliveries; Waiting for the verdict no longer nags; An unassigned delivery can be covered by the verdict; The documented default verdict type is accepted; Unreadable worker holds suppress only assignment prompts; Parked merges resume when CI turns green; Bounded retries report the actual outcome; A merge keeps its reply and its close; Keep delivery code covered after docs pushes; Bounded verification and background waits
Messages	3	Peer answers resume the asking supervisor; Keep legitimate deadlines and retries; Quiet idle turns and peer FYIs
Releases	5	One command validates a commit on hosted CI; Isolated, recoverable hosted prechecks; Queued builds run again; Refused at the request; Killed builds no longer leak disk
Total	25	5 areas

Freeze to published

Scope freeze to the GitHub release being published

20m 41s

Green to published

Over the 10m budget; merge-queue CI completion to publication

> Changes and GitHub issues are counted separately. A change is one titled entry in the v3.98.0 CHANGELOG section; entries under Test, Doc or Known limits headings are listed under the hood but not counted. A GitHub issue counts when release PR #1453 or the CHANGELOG section references it and it closed between the PR opening (2:22 AM ET) and 15 minutes after its merge (3:04 AM ET). Issues are closed by hand shortly after the merge, so a report run inside that window waits for referenced issues that are still open. No GitHub issues are counted in this report's fixes ledger. The release receipt records no blocked stage and no manual intervention, and the merge queue ejected nothing. Not measured for this release: request to published, cut to published, lesson recurrence, verifier tokens.

02 / 06

What you can do now

Releases

One review per release

WAS

Each finished piece of work in a release got its own separate review.

NOW

One verdict for the whole release closes the work it covers, with no per-item reminders while it waits.

Check a commit in one command

WAS

Checking a commit before release needed a full local build and browser setup.

NOW

`cas release precheck <commit>` runs the same checks on hosted CI and reports the result.

Merges finish themselves

WAS

A merge refused because tests were still running had to be retried by hand.

NOW

It completes on its own when the tests pass, and a failure sends one clear notice.

Test builds

Test builds on request work on Linux

WAS

Some Linux machines refused every requested test build within seconds.

NOW

Requested builds run inside their sandbox and return the finished build, about two minutes on our main machine.

Clear refusals

WAS

A machine that could not build reported "queued" and then failed later.

NOW

It refuses at the request and says why.

No leftover disk use

WAS

A stopped build could leave up to 20 GB behind.

NOW

The next build clears whatever a stopped build left, and leaves a running build alone.

Commander

Session dots show three states

WAS

An idle session showed an open green ring, and a stopped one could look alive.

NOW

Green means working, muted green means idle, and gray means disconnected.

Dismissed sessions come back

WAS

A dismissed session could be unreachable, and a restore on another device did not show on the first.

NOW

Dismissed sessions stay reachable, and a restore shows on every browser.

Fewer interruptions

Busy work is not called stalled

WAS

A long build or test run could be reported as stalled while it was working.

NOW

Work running in the background counts as busy, and only work that has truly stopped is reported as stalled.

Answers reach the person who asked

WAS

A reply to a question between machines could sit unread until something else happened.

NOW

The answer brings the person who asked back to it, and plain notices do not interrupt.

Quieter idle time

WAS

Idle sessions produced empty status updates and repeated reminders.

NOW

Empty updates and repeat reminders are gone.

03 / 06

Under the hood

Closeout

One verifier per release

WAS

With `qa.mode=batch`, each merged delivery dispatched its own verifier (9 on 3.96, 1.57M fresh tokens).

NOW

`verification action=batch_receipt verification_type=release` records one verdict that closes the covered Tier 1 deliveries, including unassigned ones.

No waiting-delivery nags

WAS

Each Tier 1 delivery waiting for the verdict woke the supervisor as a blocked close.

NOW

Deliveries wait quietly for the verdict, and unreadable worker holds suppress only assignment prompts.

Hosted queue precheck

WAS

Prechecks needed a local build, both npm installs and Playwright.

NOW

`cas release precheck <sha>` pushes a precheck ref and runs the queue suite on hosted CI. Python runs isolated, run discovery is bounded, failures are reported honestly and refs are cleaned up.

CI-gated merge retry

WAS

A merge refused for pending CI needed a supervisor retry.

NOW

The authorized merge persists and runs when CI turns green. A terminal non-green result or a two-hour wait sends one notice, and a landed merge keeps its close gate as a follow-up.

Documented verdict type accepted

WAS

`batch_receipt` rejected its documented default, `verification_type=task`.

NOW

That type records a batch QA receipt.

Docs pushes keep code covered

WAS

A docs-only follow-up push cancelled the code CI run and forced an override.

NOW

Each push is compared with its delivery fork, so the code run's coverage is kept.

Candidates

Sandbox no longer nests itself

WAS

Queued builds ran `/proc/self/exe` inside bwrap, which resolved to bwrap and failed with "No permissions to create a new namespace".

NOW

The builder execs the real binary. Measured on soundwave: request to receipt in 133 s under the daemon's sandbox.

Early refusal and self-probe

WAS

Hosts without a usable sandbox accepted requests and failed later.

NOW

The daemon probes the sandbox at startup, and requests are refused at admission with the reason.

Killed builds clean up

WAS

A timed-out or interrupted build left its checkout and target behind.

NOW

A normal exit removes the checkout and target. A kill cannot unwind, so the next build removes what it left and leaves a running build alone.

Runtime

MCP merge stack budget

WAS

On dev-profile builds, a supervisor merge or closing verdict overflowed the 2 MiB tokio worker stack (about 2.03 MB of frames), losing the reply and the close.

NOW

The heavy merge and close futures are boxed (782 KB measured), and a test holds the path under a 1 MiB budget.

Process-tree liveness

WAS

Liveness read only the harness pid's CPU, so a busy background child read Stalled after 120 s.

NOW

CPU is summed over descendants when user work exists, and the root's CPU is used for inference without children.

Peer reply wakes

WAS

Untyped replies to actionable peer messages did not wake the idle asker.

NOW

Replies and explicit answers wake the asker once, and FYI receipts stay quiet.

Legitimate timers kept

WAS

Refusing polling reminders could also refuse timers such as "Retry capped build check".

NOW

Deadlines and retries are accepted, and status polls are still refused.

Quieter planning

WAS

Operation lessons and recalled context could repeat or carry weak matches, and worker reminders could outlive their work.

NOW

Lessons match the spawned harness and appear once per session, recall filters weak matches and repeats, and worker reminders end with shutdown or terminal tasks.

Cross-device restore

WAS

A restore on another device left the dismissing browser hiding the session.

NOW

The restore is reconciled on every browser.

Three-state session dots

WAS

A live idle session showed an open green ring, and a stopped session could read as alive.

NOW

The `--state-ok`, `--state-idle` and `--state-off` tokens map working, idle and disconnected.

Bounded waits and quieter turns

WAS

Approved verdicts could block forever, and delay reminders could poll inboxes.

NOW

Verification and background waits have deadlines, polling reminders are refused, and content-free idle bubbles are omitted.

Evidence and scope

Retrieved: 2 November 2026 · 3:12 AM ET.

Source: CHANGELOG `CHANGELOG.md`, release-notes draft `docs/release-notes/2026-11-02-v3.98.0-slack.md`, GitHub `Richards-LLC/cassy` release v3.98.0; retrieved 2 November 2026 · 3:12 AM ET.

The generator places each change in an area by the words in its title and text. This report corrected that by hand: merge and verdict work moved to Tasks, session dots and restores to Commander, peer messages and timers to Messages, test builds and prechecks to Releases. One title containing code was reworded in plain words. The count stays 25.

Release PR: https://github.com/Richards-LLC/cassy/pull/1453 `(https://github.com/Richards-LLC/cassy/pull/1453)` (merged 2 November 2026 · 2:49 AM ET).

Release-notes draft: `docs/release-notes/2026-11-02-v3.98.0-slack.md`.

CHANGELOG source: `CHANGELOG.md`.

GitHub release: https://github.com/Richards-LLC/cassy/releases/tag/v3.98.0 (https://github.com/Richards-LLC/cassy/releases/tag/v3.98.0) (published 2 November 2026 · 3:09 AM ET; tag v3.98.0 at commit 42966998; main at 7cc188243).

Release receipt: durable artifact `art-37a769e2` (`release-latency.receipt`).

Freeze to publication

Freeze is the commit the closeout review was scoped to. Queue entry is the merge-queue commit's time, and landing is GitHub's merged time. Both releases use the same method.

MILESTONE	V3.98.0	V3.97.0
Scope frozen	1 Nov · 11:41 PM ET	1 Nov · 7:16 PM ET
Entered merge queue	2 Nov · 2:29 AM ET (2h 48m after freeze)	1 Nov · 9:42 PM ET (2h 26m after freeze)
Landed on main	2 Nov · 2:49 AM ET (3h 08m after freeze)	1 Nov · 10:03 PM ET (2h 48m after freeze)
Published	2 Nov · 3:09 AM ET (3h 28m after freeze)	1 Nov · 10:16 PM ET (3h 01m after freeze)

Freeze commits: `c89e32e81` for v3.98.0 and `0b194f2c8` for v3.97.0. On these endpoints v3.98.0 reached main 20 minutes later than v3.97.0, so this report makes no claim that closeout got faster between them. The v3.96.0 baseline was recorded as about 6.5 h with no stated endpoints, so it is not compared here.

The closeout ran one full review, one batch fix, one re-review of the fix and one QA round. The merge queue ran once, with one CI run and no ejection.

Why publication ran over budget

The Release workflow's lookup of prebuilt artifacts took 16m 21s, from 2:49 AM to 3:06 AM ET, and ended as the Release Prebuild run started at queue entry (2:30 AM ET) finished. The packaged Linux audit then took 2m 57s. Run: https://github.com/Richards-LLC/cassy/actions/runs/41408793524 (https://github.com/Richards-LLC/cassy/actions/runs/41408793524).

Not in this report

No before and after images: the release's QA captures show the new session dots only, with no capture of the earlier dots on the same screen.

Pipeline latency

Stage timings are unavailable: the latency receipt records no STAGE_SECS.

No source warnings.
