What you can do now

02 / 06

Safer coordination

Clear identities

WAS one exact identifier was required.

NOW start, claim, and close accept a name or ID.

Supported messages

WAS coordination could use the wrong transport.

NOW messages stay on the supported path.

Gate ownership

WAS only one owner could finish a gate.

NOW authorized reviewers can finish it and get a clear ownership warning.

Bounded completion

WAS large completion checks could wait too long.

NOW checks finish within a limit and safely show unfinished work.

Retryable proof

WAS a close retry could lose approved evidence.

NOW the approved evidence is reused when the proof is still valid.

Merged results

WAS proof could point at an old result after a merge.

NOW it follows the result that was actually published.

Clearer recovery

Credential settings

WAS variable placeholders could fail silently.

NOW values and defaults expand, and missing required settings explain the fix.

Hub recovery

WAS a stuck hub could block a restart.

NOW startup is transactional, forced recovery restores service, and health checks explain the remedy.

Fresh notices

WAS old assignment notices could reappear.

NOW they disappear once the work has started or finished.

Protected execution

Profile write-through

WAS credentials in linked profiles did not reliably follow the profile.

NOW configured credentials and linked profile updates stay in sync.

Whole-process stopping

WAS stopping a service could leave its children running.

NOW the complete process group is stopped and checked.

Accurate proof targets

WAS test data could point proof at the wrong target.

NOW declarations identify the target precisely.

Oversized entries

WAS oversized history entries could remain quarantined.

NOW they are shortened, retried, and recorded as recovered.

Protected image credentials

WAS image-service keys could appear in command details.

NOW the key is sent through a protected temporary header file.

Lifecycle contracts

Assignee identities (#799)	WAS lifecycle calls required one identity form. NOW UUID and name resolve to the same assignee. Commit 42ae8311.
Message routing (#793)	WAS supervisors could use the host SendMessage transport. NOW supervisor coordination uses the CAS message path. Commit 86db4c81.
Gate ownership (#800)	WAS worker-assigned gates could not be closed by the supervisor. NOW supervisor closure is supported and cross-owner assignment warns. Commit c34f25e3.
Epic close (#802)	WAS close evaluated children with unbounded repeated probes. NOW batched probes are bounded and partial evaluation fails closed. Commit d53e32d0.
Close retry (#755)	WAS retrying could mint a new dispatch and orphan an approved verdict. NOW superseded dispatches preserve the approved result. Commit 9d7e1b49.
Post-merge proof (#753)	WAS proof could bind to a stale worker checkout. NOW post-merge verification binds to the published target head. Commit 9d7e1b49.

Runtime recovery

Proxy variables (#803)	WAS proxy configuration treated <code>\${VAR}</code> as literal text. NOW <code>\${VAR}</code> and <code>\${VAR:-default}</code> expand, with <code>missing_credential_env</code> for required gaps. Commit 0a16d12e.
Hub startup (#804)	WAS a lock holder could strand startup between auth, bind, and recording. NOW startup is transactional and <code>--force</code> recovers wedged holders with a doctor remedy. Commit 219a033b.
Assignment delivery (#756)	WAS delivered assignment boilerplate could replay after state changed. NOW direct, queued, MCP, and hook paths revalidate task state. Commit c43b112e.
Credential profiles (#758)	WAS isolated processes missed credentials from configured files and linked profiles. NOW credential discovery and symlink write-through are preserved. Commit 87614f4a.

Execution and proof

Process groups (#796)	was stopping a registered PID could leave nested watchers alive. now each service has a dedicated group and stop verifies no survivors. Commit fc40166a.
Scoped proof (#778)	was source-path strings could claim integration-test ownership. now exact targets and module declarations determine ownership. Commit 67733a3b.
Embedding recovery (#805)	was provider-size failures quarantined units permanently. now oversized units are truncated, retried, and marked with a recovery receipt. Commit d386dc56.
Image credentials (#757)	was the API key appeared in curl arguments. now a mode-600 header file carries the key without exposing it in argv. Commit 5dabbdcc.
