Install proofs

Apple Silicon macOS and clean Linux jobs passed on the published SHA

The closure window is strictly after v3.25.6 publication at 2026-09-15T13:21:02Z and inclusive of v3.25.7 publication at 2026-09-15T17:13:20Z. The release-day issue query returned only #869 (closed 16:52:27Z) and #879 (closed 16:52:28Z) in that interval. Each was checked against the published source; neither the two Fixed changelog bullets nor a task completion alone determines the issue count.

▼ Change map · data and reading guide

Each filled dot represents one GitHub issue closed as completed in this release window whose delivered fix is present in the published source. The map counts verified issue closures, not changelog entries or the volume of shipped work.

SURFACE	ISSUES CLOSED	ISSUE NUMBERS
---------	---------------	---------------

SURFACE	ISSUES CLOSED	ISSUE NUMBERS
Checks	0	No completed closure in this surface was verified in-window
Release	0	No completed closure in this surface was verified in-window
Factory · hosted terminal	1	#869
Factory · rolling integration	1	#879
Hub	0	No completed closure in this surface was verified in-window
Total	2	Two verified completed closures

The map retains the v3.25.6 surface order and splits Factory into the two shipped areas. GitHub's exact closure records are [#869](https://github.com/Richards-LLC/cassy/issues/869) (<https://github.com/Richards-LLC/cassy/issues/869>) and [#879](https://github.com/Richards-LLC/cassy/issues/879) (<https://github.com/Richards-LLC/cassy/issues/879>); both fixes are in the published tag. Open issues and changelog entries are not closures. The [release-day closed-issue search](https://github.com/Richards-LLC/cassy/issues?q=is%3Aissue+is%3Aclosed+closed%3A2026-09-15) (<https://github.com/Richards-LLC/cassy/issues?q=is%3Aissue+is%3Aclosed+closed%3A2026-09-15>) was refreshed around 17:22Z; exact closure times appear in the ledger. Compare the [published sources](https://github.com/Richards-LLC/cassy/compare/v3.25.6...v3.25.7) (<https://github.com/Richards-LLC/cassy/compare/v3.25.6...v3.25.7>).

What you can do now

02 / 06

Keep work moving

Type in the hosted terminal with the cursor in view

WAS a focused terminal harness could hide its cursor or leave it at the wrong position in the Cassy pane.

NOW the focused pane follows the child terminal's cursor position, visibility, and shape through redraw and resize. Unfocused panes and modal behavior remain suppressed as intended.

Let rolling checks cross midnight

WAS a long-running factory daemon could keep watching yesterday's UTC log and miss newly written merge events.

NOW rolling integration follows the current UTC session log, retains incomplete lines, filters by session, and processes each matching merge event once.

Scope limits: a separate local all-project refresh returned cloud `project_not_found`, so no host-wide pass is claimed. No report upload or v3.25.7 Slack post is evidenced; v3.25.6 receipts are historical. The PDF is untagged; screen-reader behavior is untested.

Hosted terminal rendering

Preserve the child's current cursor state

WAS a cursor emitted by the child could remain hidden in the pane buffer or be absent or displaced in the host terminal.

NOW the published rendering path forwards the focused PTY cursor position and style to the host, while focus and modal state continue to control visibility. The accepted geometry check used a rebuilt Cassy binary and a deterministic local child through hosted rendering. This is not evidence of an authenticated Codex or Claude session.

Rolling integration recovery

Follow dated session logs

WAS a daemon could keep polling only the UTC-date log it opened at startup, missing later merge events after midnight.

NOW the coordinator follows dated session logs through the current UTC day, retains partial JSONL records until complete, filters events to its factory session, and processes each matching merge once.

Recover a missed integration through the real sweep

WAS after rollover left an integration receipt stale, there was no bounded one-shot path to recover the focused epic without restarting a live factory session.

NOW the hidden `cas factory integration-recover` command accepts only the live registered supervisor bound to the active factory session, same Git project, and focused epic. It constructs the production rolling-integration coordinator in a fresh process and runs the real sweep; it refuses when sweeps are disabled or another sweep is active, caps recovery at four times the configured sweep timeout and four hours, and reports success only for a passing receipt.

Fixes ledger

Issue register · 2 verified closures

ISSUE	COMPLETED CLOSURE (UTC)	SURFACE	DELIVERED EVIDENCE
