What you can do now

02 / 06

Only reply:

Conversations at a glance

WAS a list of session names. →

NOW each supervisor is a row in its machine's colour with its project, the last line said, and a clear mark for "waiting on you" versus "unread".

A thread you can read

WAS the terminal's raw text mirrored into the page. →

NOW your messages on the right, the supervisor's on the left, runs of status updates folded into one quiet line, receipts ticked, and a working indicator while it is busy.

Questions you answer with a tap

WAS a question looked like any other message. →

NOW it stands out as its own amber object with reply chips, stays pinned above your message box until answered, and your tap reaches the supervisor bound to that question.

Blockers you can see

WAS a hold read like ordinary text. →

NOW it is a red object carrying the exact evidence line.

Reports you can open

WAS a link inside a bubble. →

NOW a paper sheet with a folded corner; tap it to open the report.

Phone first

WAS desktop layout squeezed onto a phone. →

NOW the list fills the phone with a compose button, and even a long evidence table fits without sideways scrolling.

Under the hood

03 / 06

Only reply:

Tokens and accents

WAS one shell palette. →

NOW PAPER semantic tokens (canvas, panel, bubble pairs, ask, crit, four lift shadows) light and dark, plus three machine accent sets assigned by FNV-1a + jump consistent hash (append-safe); a unit test measures 144 rendered pairs $\geq 4.5:1$.

Thread model	WAS render logic in the view. → NOW thread-model.ts is a pure grouping/coalescing/day/working/evidence-table model with tests; conversation-view.ts renders pebbles from it and exposes registerTurnRenderer(ask blocker attachment) as the single seam for object turns.
Ask, blocker, attachment objects	WAS data-kind bubbles and a link row. → NOW fused-tray ask/blocker with quick-reply chips and a pinned copy above the composer; dog-eared attachment sheet per artifact; empty state; accent composer.
Reply reference	WAS ClientMessage::SendMessage had no in_reply_to, and hub/server re-parsed the frame, dropping it. → NOW optional in_reply_to (serde default, keyless when absent), forwarded unchanged; the daemon validates it names a supervisor→operator turn of the session, prefixes the queued text with the explicit reply reference, and acks the ask.
Pane mirror	WAS the transcript article in the default conversation. → NOW removed; the ghostty terminal stays as the explicit alternate view.
Assembly QA	WAS per-lane screenshots. → NOW strict visual QA 25 fixtures × 2 schemes × 3 viewports with 0 findings, a 68-pair contrast table (tightest 4.85:1), 134 Playwright receipts including the in_reply_to frame on the built bundle, and side-by-side composites against the design PNGs with every deviation named; dist rebuilt once from the assembled tree.
Assets	WAS n/a. → NOW cas-x86_64-unknown-linux-gnu.tar.gz 92f5235ac45bf83bba4e2d8315ac9c0173a2270339ef5b1d9e778f29c1168cee; cas-aarch64-apple-darwin.tar.gz e8c928186cb08d54a86ba0c13d35c23ca2da89a0363af7ccc33f8870834dd28e.

GitHub issue theme assignment uses labels first, then the keyword table in the CLI. Any issue classified as Unclassified is shown in the map so a human can correct the Markdown before rendering.
