What you can do now

02 / 06

Only reply (user)

Tests while building

WAS new tests first ran hours later, at release time. →

NOW each change runs the tests it affects before it is handed off.

Earlier checks

WAS some cheap checks only ran just before a release. →

NOW they run every time a change is merged.

Clearer change summaries

WAS a change arrived as a list of commit messages. →

NOW it shows a short picture of what changed, before-and-after proof, and how risky it is to undo.

Lessons that stick

WAS the same kind of mistake could come back release after release. →

NOW a mechanical mistake turns into an automatic check the first time it happens.

Finished means shipped

WAS work could be called done while still waiting to be released. →

NOW a release is complete only when the installed version provably contains every change.

Under the hood

03 / 06

Only reply (dev)

Targeted tests

WAS workers could run only `cargo check`. →

NOW `cargo nextest run -p <crate> -E 'test(name)'` through the capped `O_CLOEXEC` runner, with zero-match failure and clean-commit receipts.

Two-axis review

WAS one task-verifier verdict mixed spec and standards. →

NOW separate Spec and Standards reviewers commit to side refs and cross-check each other, supervisor-only and in shadow mode; `CODING_STANDARDS.md` feeds Standards.

Merge-time gate rows

WAS workflow interpolation, test inventory and doc hygiene surfaced at the release gate. →

NOW `release-gate.sh --fast-rows` runs at every lane merge and in Scoped Validation, with a test-shape lint and a ratcheted process-state lint that requires the shared test-env guard.

Learning loop	WAS 25 draft rules and no encode chores. → NOW a mechanical rule files its check on first occurrence; cas-retro turns release evidence into tasks.
Contract registry	WAS hundreds of wording pins across skill tests. → NOW one registry of reasoned contract phrases, with every negative safety guard kept.
Release train	WAS the gate re-ran the suite, and a latency overrun or a stale resume stopped the cut. → NOW proof reuse names the first differing input, overruns are recorded, resume re-assemblies, and rule-175 requires install proof of every merged change.
Terminal exchange	WAS keyframe-before-output order was pinned by a test that read source text. → NOW one owned daemon step captures, drains and queues, and a test checks the order of delivered frames.
Store and sync	WAS JSON-array proof_targets were stored as fragments, and a team pull could revert awaiting_merge. → NOW targets are normalised by migration 262, and lifecycle regressions are refused.

Fixes ledger
